

# Low Hop Emulators and Uncapacitated Min-Cost Flow<sup>1</sup>

Caleb Ju and Tim Baer

PPoSS Planning Group  
University of Illinois at Urbana-Champaign

October 15, 2020

---

<sup>1</sup>Based on results from *Parallel Approximate Undirected Shortest Paths Via Low Hop Emulators* by Andoni, Stein, and Zhong (published in STOC 2020).

- 1 Low Hop Emulators and Applications
- 2 Constructing a Low Hop Emulator
- 3 Uncapacitated Min-Cost Flow in Sherman's Framework
- 4 Constructing a Good Preconditioner

# Recent Results

## Theorem (Andoni et. al SSSP)

$\text{polylog}(n)$ -approximate single source shortest path with  $\text{polylog}(n)$  depth and  $m \cdot \text{polylog}(n)$  work via *low hop emulators*.

## Theorem (Andoni et. al $(s, t)$ -SP)

$(1 + \epsilon)$ -approximate  $(s - t)$ -shortest path with  $\text{polylog}(n)$  depth and  $m \cdot \text{polylog}(n)$  work via reduction to *uncapacitated min-cost flow*.

---

<sup>2</sup>Faster Parallel Algorithm for Approximate Shortest Path by Li (published in STOC 2020).

# What is a Low Hop Emulator?

What is a **low hop emulator**?

Given a graph  $G = (V, E)$ , a **low hop emulator** is a weighted graph  $H = (V, F)$  where any shortest  $(s - t)$ -path uses  $\mathcal{O}(\log \log n)$  edge traversals and  $|F| = \mathcal{O}(m \cdot \text{poly}(\log n))$ .

---

<sup>3</sup>Uses hierarchy of discretizations to solve a linear system.

<sup>4</sup> $d(u, v) \leq \tilde{d}(u, v) \leq f(n)d(u, v)$ , where  $f(n)$  is the approximation factor, and  $d$  and  $\tilde{d}$  are the exact and approximate distances, respectively.

# What is a Low Hop Emulator?

What is a **low hop emulator**?

Given a graph  $G = (V, E)$ , a **low hop emulator** is a weighted graph  $H = (V, F)$  where any shortest  $(s - t)$ -path uses  $\mathcal{O}(\log \log n)$  edge traversals and  $|F| = \mathcal{O}(m \cdot \text{poly}(\log n))$ .

- Is multigrid inspired<sup>3</sup>
- Provable approximation/distortion factors<sup>4</sup>
- Can be constructed in parallel

---

<sup>3</sup>Uses hierarchy of discretizations to solve a linear system.

<sup>4</sup> $d(u, v) \leq \tilde{d}(u, v) \leq f(n)d(u, v)$ , where  $f(n)$  is the approximation factor, and  $d$  and  $\tilde{d}$  are the exact and approximate distances, respectively.

# Applications

- ① Uncapacitated min-cost flow: find cheapest way to *route* flow from supply vertices to demand vertices
- ② Bourgain's embedding: embed *any* metric space into  $\ell_p$  with distortion  $\mathcal{O}(\log n)$
- ③ Low diameter decomposition: decompose a graph into subsets such that *far* vertices are *unlikely* to belong to the same subset

# Constructing the Low Hop Emulator

Given a graph  $G = (V, E)$ , a **low hop emulator** is a weighted graph  $H = (V, F)$  where any shortest  $(s - t)$ -path uses  $\mathcal{O}(\log \log n)$  edge traversals and  $|F| = \mathcal{O}(m \cdot \text{poly}(\log n))$ .

How can we build a low hop emulator?

# Constructing the Low Hop Emulator

Given a graph  $G = (V, E)$ , a **low hop emulator** is a weighted graph  $H = (V, F)$  where any shortest  $(s - t)$ -path uses  $\mathcal{O}(\log \log n)$  edge traversals and  $|F| = \mathcal{O}(m \cdot \text{poly}(\log n))$ .

How can we build a low hop emulator?

- 1 Build a sparser graph using a **subemulator**
- 2 Recursively apply subemulator  $\mathcal{O}(\log \log n)$  times

# Constructing the Low Hop Emulator

Given a graph  $G = (V, E)$ , a **low hop emulator** is a weighted graph  $H = (V, F)$  where any shortest  $(s - t)$ -path uses  $\mathcal{O}(\log \log n)$  edge traversals and  $|F| = \mathcal{O}(m \cdot \text{poly}(\log n))$ .

How can we build a low hop emulator?

- 1 Build a sparser graph using a **subemulator**
- 2 Recursively apply subemulator  $\mathcal{O}(\log \log n)$  times

A **subemulator** is a graph  $H = (S, F')$  where  $S \subset V$  and  $F'$  is a weighted edge set that approximates distances well.

# Constructing a Subemulator

A **subemulator** is a graph  $H = (S, F')$  where  $S \subset V$  and  $F'$  is a weighted edge set that approximates distances well.

- ① Initially construct  $S$  by sampling vertices
- ② Add more vertices to ensure every vertex is close to a vertex in  $S$
- ③ Add weighted edges so that local distances are well-approximated

# Constructing a Subemulator

A **subemulator** is a graph  $H = (S, F')$  where  $S \subset V$  and  $F'$  is a weighted edge set that approximates distances well.

- 1 Initially construct  $S$  by sampling vertices
- 2 Add more vertices to ensure every vertex is close to a vertex in  $S$
- 3 Add weighted edges so that local distances are well-approximated

The **ball**,  $B_{G,b}(v)$ : closest  $b$  vertices (w.r.t graph distance) to  $v$ .

Figure: Ball

# Selecting Vertices

- 1 Initially construct  $S$  by sampling vertices
- 2 Add vertices to  $S$  so that every  $v \in V$  is close to a vertex in  $S$
- 3 Add weighted edges so that local distances are well-approximated

Given ball size  $b$  (typically  $b = \mathcal{O}(\log n)$ ).

- 1 For every vertex  $v \in V$ , construct its ball  $B(v)$
- 2 Construct  $S$  by sampling every vertex with probability  $p = \min(50 \frac{\log n}{b}, \frac{1}{2})$
- 3 For any  $v \in V \setminus S$  whose ball does not contain any vertex in  $S$ , then add  $v$  to  $S$
- 4 Store the  $\text{leader}(v) \leftarrow$  closest vertex  $u \in S$  to  $v \in V$

Output: A sparse vertex set  $S$  and leader mapping  $q : V \rightarrow S$

# Selecting vertices

Can we only compute the balls for the **sampled** vertices?

For any  $v \in V \setminus S$  whose ball does not contain any vertex in  $S$ , then add  $v$  to  $S$

Figure: Line 4 of selecting vertices

For any  $v \in V \setminus S$  that is not contained in the ball of any vertex in  $S$ , then add  $v$  to  $S$

Figure: Only compute balls for sampled vertices

# Adding Edges

- ➊ Initially construct  $S$  by sampling vertices
- ➋ Add more vertices to ensure vertex in  $V$  is close to a vertex in  $S$
- ➌ Add weighted edges so that local distances are well-approximated

# Adding Edges

- 1 Initially construct  $S$  by sampling vertices
- 2 Add more vertices to ensure vertex in  $V$  is close to a vertex in  $S$
- 3 Add weighted edges so that local distances are well-approximated

Denote  $q(v) = \text{leader}(v) \in S$

Figure: For every edge from  $G$ , add edge between the leaders

Figure: For every pair of vertices that are “close”, add an edge between their leaders

# Adding Edges

Denote  $q(v) = \text{leader}(v) \in S$ .

- 1 For every  $(u, v) \in E$ , add edge  $(q(u), q(v))$
- 2 For every  $v \in V, u \in B(v)$ , add edge  $(q(u), q(v))$

Set  $w(e) = \min \begin{cases} w(e), (\text{initialize to } \infty) \\ d_G(q(u), u) + d_G(u, v) + d_G(v, q(v)) \end{cases}$ .

Figure:

# Properties of Subemulators

Let  $H = (S, F')$  be a subemulator of  $G$ .

- $\mathbb{E}[|S|] \leq \frac{3}{4}n$  and  $|F'| \leq m + nb$
- For any  $u, v \in S$ , their distance in  $H$  is distorted by a constant factor<sup>5</sup>
- For any  $u, v \in V$ , the distance between their leaders in  $H$  is distorted by a constant factor<sup>6</sup>

A **subemulator** is a graph  $H = (S, F')$  where  $S \subset V$  and  $F'$  is a weighted edge set that approximates distances well.

<sup>5</sup>For any  $u, v \in S$ ,  $d_G(u, v) \leq d_H(u, v) \leq 8 \cdot d_G(u, v)$ .

<sup>6</sup>For any  $u, v \in V$ ,  $d_H(q(u), q(v)) \leq d_G(u, q(u)) + 22 \cdot d_G(u, v) + d_G(v, q(v))$ .

# Constructing the Low Hop Emulator

Given a graph  $G = (V, E)$ , a **low hop emulator** is a weighted graph  $H = (V, F)$  where any shortest  $(s - t)$ -path uses  $\mathcal{O}(\log \log n)$  edge traversals and  $|F| = \mathcal{O}(m \cdot \text{poly}(\log n))$ .

How can we build a low hop emulator?

- 1 Define a restriction operator via subemulator
- 2 Recursively apply subemulator  $\mathcal{O}(\log \log n)$  times

# Combining Nested Subemulators as $H$ (Distance Oracle)

- 1 Form  $t = \mathcal{O}(\log \log n)$  recursive subemulators
- 2 Add an edge from a vertex to its leaders in the next level
- 3 Keep edges within each subemulator
- 4 Add edges between “close” vertices in the same level

Scale:  $w_H(u, v) = 27^{t - \max(|\text{lvl}(u), \text{lvl}(v)|)} \cdot d_{H_i}(u, v).$

Figure: Scaling edges

# Properties of a Distance Oracle

## Lemma

*Let  $H$  be distance oracle.*

- $|E(H)| = \mathcal{O}(m \cdot \text{poly}(\log n))$
- *For every  $u, v \in V$  and corresponding  $u^{(0)}, v^{(0)} \in H_0$  (in the bottom level of  $H$ ), then  $d_H(u^{(0)}, v^{(0)})$  is distorted by at most  $\text{polylog}(n)$ <sup>7</sup>*

---

<sup>7</sup>Precisely,  $d_G(u, v) \leq d_H(u^{(0)}, v^{(0)}) \leq 26^{\mathcal{O}(\log \log n)} \cdot d_G(u, v)$

# Properties of a Distance Oracle

## Lemma

*Let  $H$  be distance oracle.*

- $|E(H)| = \mathcal{O}(m \cdot \text{poly}(\log n))$
- *For every  $u, v \in V$  and corresponding  $u^{(0)}, v^{(0)} \in H_0$  (in the bottom level of  $H$ ), then  $d_H(u^{(0)}, v^{(0)})$  is distorted by at most  $\text{polylog}(n)^7$*

Given a graph  $G = (V, E)$ , a **low hop emulator** is a weighted graph  $H = (V, F)$  where any shortest  $(s - t)$ -path uses  $\mathcal{O}(\log \log n)$  edge traversals and  $|F| = \mathcal{O}(m \cdot \text{poly}(\log n))$ .

<sup>7</sup>Precisely,  $d_G(u, v) \leq d_H(u^{(0)}, v^{(0)}) \leq 26^{\mathcal{O}(\log \log n)} \cdot d_G(u, v)$

# Creating the Ball Centered at $v$ (in parallel)

$B_{G,b}(v) = \{\text{closest } b \text{ vertices to } v\}.$

Goal: Build all  $n$  balls in  $\log n$  depth and nearly linear work.

# Creating the Ball Centered at $v$ (in parallel)

$B_{G,b}(v) = \{\text{closest } b \text{ vertices to } v\}$ .

Goal: Build all  $n$  balls in  $\log n$  depth and nearly linear work.

Idea 1: Compute all pairs shortest path (APSP) using  $\log(n)$  *path doublings*. Then save  $b$  closest vertices.

Cost:  $\log(n)$  iterations with  $\mathcal{O}(n^3 \cdot \log(n))$  work.

# Creating the Ball Centered at $v$ (in parallel)

$B_{G,b}(v) = \{\text{closest } b \text{ vertices to } v\}$ .

Goal: Build all  $n$  balls in  $\log n$  depth and nearly linear work.

Idea 1: Compute all pairs shortest path (APSP) using  $\log(n)$  *path doublings*. Then save  $b$  closest vertices.

Cost:  $\log(n)$  iterations with  $\mathcal{O}(n^3 \cdot \log(n))$  work.

Idea 2: Compute *partial* APSP using  $\log(b)$  *truncated* path doublings. After each path doubling, keep  $b$  closest vertices.

Cost:  $\log(b)$  iterations with  $\mathcal{O}(n \cdot b^2 \cdot \log(n))$  work. Set  $b = \mathcal{O}(\log n)$ .

## Creating the Ball Centered at $v$ (in parallel)

Let  $\mathbf{B}^{(i)} \in \mathbb{R}^{n \times n}$  on the  $(\min, +)$  semiring contain the tentative distances to the  $b$  closest vertices to vertex  $u, \forall u \in V$ .

$$\mathbf{B}^{(i+1)} = F[\mathbf{B}^{(i)} \mathbf{B}^{(i)}]$$

where  $F$  extracts the  $b$  closest neighbors to  $u, \forall u \in V$ .

# Creating the Ball Centered at $v$ (in parallel)

Let  $\mathbf{B}^{(i)} \in \mathbb{R}^{n \times n}$  on the  $(\min, +)$  semiring contain the tentative distances to the  $b$  closest vertices to vertex  $u, \forall u \in V$ .

$$\mathbf{B}^{(i+1)} = F[\mathbf{B}^{(i)} \mathbf{B}^{(i)}]$$

where  $F$  extracts the  $b$  closest neighbors to  $u, \forall u \in V$ .

- ① Requires  $\mathcal{O}(\log b)$  iterations
- ② Parallelizable using existing matrix-matrix product techniques
- ③ Can be sparsified by specifying a row filter

# Creating the Ball Centered at $v$ (in parallel)

Alternatively, let  $B_u^{(i)}$  be a sorted  $b$ -vector containing tentative distances to the  $b$  closest vertices to vertex  $u$ .

$$B_u^{(i+1)} = B_u^{(i)} \oplus \left( \bigoplus_{(u,v) \in E} \{w(u,v) + B_v^{(i)}\} \right)$$

where the reduction operator  $x \oplus y$  merges  $x$  and  $y$  and returns the first  $b$  distances.

# Creating the Ball Centered at $v$ (in parallel)

Alternatively, let  $B_u^{(i)}$  be a sorted  $b$ -vector containing tentative distances to the  $b$  closest vertices to vertex  $u$ .

$$B_u^{(i+1)} = B_u^{(i)} \oplus \left( \bigoplus_{(u,v) \in E} \{w(u,v) + B_v^{(i)}\} \right)$$

where the reduction operator  $x \oplus y$  merges  $x$  and  $y$  and returns the first  $b$  distances.

- 1 Requires  $\mathcal{O}(b)$  iterations
- 2 Can be embedded into a generalized **matrix-vector product** with the adjacency matrix and parallelized with existing techniques
- 3 Can be sparsified by specifying a row filter

# Tuning Parameters

- ① approximation constant  $\epsilon$
- ② size of the ball  $b$
- ③ number of subemulators
- ④ sampling probability of vertices
- ⑤ scaling factor for combining nested subemulators

# Uncapacitated Min–Cost Flow (Transshipment)

Let  $\mathbf{W} \in \mathbb{R}^{m \times m}$  be a diagonal matrix of weights. Let  $\mathbf{A} \in \mathbb{R}^{n \times m}$  be the incidence matrix,

$$\mathbf{A}_{iu} = \begin{cases} 1 & : \exists \text{ edge } u = (i, j) \\ -1 & : \exists \text{ edge } u = (j, i) \\ 0 & : \text{otherwise} \end{cases}.$$

Find a vector  $f \in \mathbb{R}^m$  such that

$$\min_{f \in \mathbb{R}^m} \|\mathbf{W}f\|_1$$

$$\text{s.t. } \mathbf{A}f = b,$$

where  $b \in \mathbb{R}^n$  is the **demand vector**, where we require  $\sum_i b_i = 0$ .

If  $b(s) = 1$ ,  $b(t) = -1$ , then solves  $(s, t)$ –shortest path length.

# Uncapacitated Min-Cost Flow (Transshipment)

An equivalent problem:

Let  $x = \mathbf{W}f$ . Find the optimal  $x^*$  such that

$$\begin{aligned} x^* = \min_{x \in \mathbb{R}^m} \|x\|_1 \\ \text{s.t. } \mathbf{A}\mathbf{W}^{-1}x = b. \end{aligned}$$

# Uncapacitated Min-Cost Flow (Transshipment)

An equivalent problem:

Let  $x = \mathbf{W}f$ . Find the optimal  $x^*$  such that

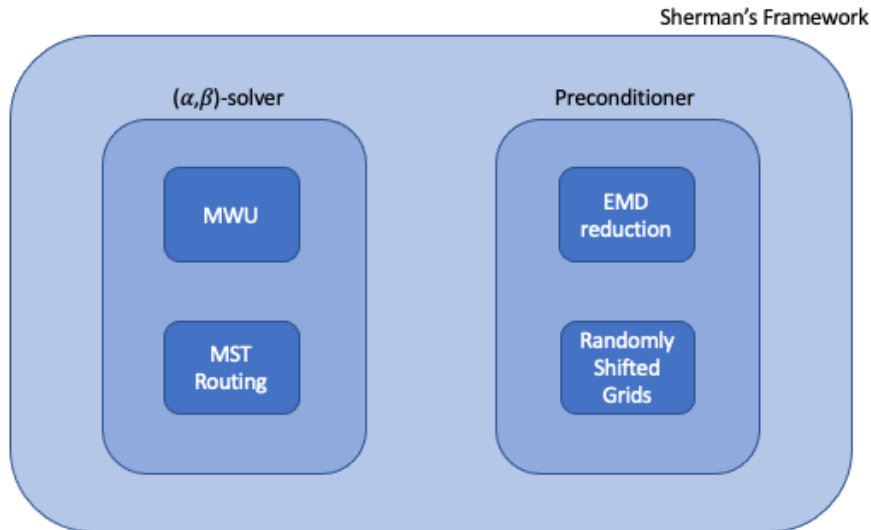

$$\begin{aligned} x^* &= \min_{x \in \mathbb{R}^m} \|x\|_1 \\ \text{s.t. } \mathbf{A}\mathbf{W}^{-1}x &= b. \end{aligned}$$

Lemma: There exists  $(1 + \varepsilon)$ -approximation algorithm to the optimization problem above in that runs in polylog depth if there exists a matrix  $\mathbf{P}$  such that

$$\|x^*\|_1 \leq \|\mathbf{P}b\|_1 \leq \mathcal{O}(\text{poly log } n) \cdot \|x^*\|_1.$$

# Sherman's Framework

We use Sherman's framework to solve uncapacitated min-cost flow.

# Sherman's Framework<sup>8</sup>

Let  $\mathcal{X}, \mathcal{Y}$  be finite dimensional vector spaces, where  $\mathcal{X}$  is also a Banach space, and let  $\mathbf{A} \in \text{Lin}(\mathcal{X}, \mathcal{Y})$  be fixed. Consider the problem:

$$\begin{aligned} \min_{x \in \mathcal{X}} \|x\|_{\mathcal{X}} \\ \text{s.t. } \mathbf{A}x = b, \end{aligned}$$

---

<sup>8</sup>Based on results from *Generalized Preconditioning and Network Flow Problems* by Sherman (published in SODA 2017).

# Sherman's Framework<sup>8</sup>

Let  $\mathcal{X}, \mathcal{Y}$  be finite dimensional vector spaces, where  $\mathcal{X}$  is also a Banach space, and let  $\mathbf{A} \in \text{Lin}(\mathcal{X}, \mathcal{Y})$  be fixed. Consider the problem:

$$\begin{aligned} \min_{x \in \mathcal{X}} \|x\|_{\mathcal{X}} \\ \text{s.t. } \mathbf{A}x = b, \end{aligned}$$

$x$  is an  $(\alpha, \beta)$ -solution to the above problem if

①  $\frac{\|x\|}{\|x_{opt}\|} \leq \alpha$ , and

②  $\frac{\|\mathbf{A}x - b\|}{\|\mathbf{A}\| \|x_{opt}\|} \leq \beta$

---

<sup>8</sup>Based on results from *Generalized Preconditioning and Network Flow Problems* by Sherman (published in SODA 2017).

# Sherman's Framework

$x$  is an  $(\alpha, \beta)$ -solution to the above problem if

①  $\frac{\|x\|}{\|x_{opt}\|} \leq \alpha$ , and

②  $\frac{\|Ax - b\|}{\|A\| \|x_{opt}\|} \leq \beta$

The **non-linear condition number** of  $A : \mathcal{X} \rightarrow \mathcal{Y}$  is

$$\kappa_{\mathcal{X} \rightarrow \mathcal{Y}}(A) = \min \left\{ \frac{\|A\|_{\mathcal{X} \rightarrow \mathcal{Y}} \|x\|_{\mathcal{X}}}{\|Ax\|_{\mathcal{Y}}} : Ax \neq 0 \right\}$$

# Sherman's Framework

$x$  is an  $(\alpha, \beta)$ -solution to the above problem if

①  $\frac{\|x\|}{\|x_{opt}\|} \leq \alpha$ , and

②  $\frac{\|Ax - b\|}{\|A\| \|x_{opt}\|} \leq \beta$

The **non-linear condition number** of  $A : \mathcal{X} \rightarrow \mathcal{Y}$  is

$$\kappa_{\mathcal{X} \rightarrow \mathcal{Y}}(A) = \min \left\{ \frac{\|A\|_{\mathcal{X} \rightarrow \mathcal{Y}} \|x\|_{\mathcal{X}}}{\|Ax\|_{\mathcal{Y}}} : Ax \neq 0 \right\}$$

## Theorem (Composition of solvers)

Let  $F_i$  be a  $(\alpha_i, \beta_i/\kappa)$ -solver for  $A : \mathcal{X} \rightarrow \mathcal{Y}$ , where  $A$  has non-linear condition number  $\kappa$ . Then, the composition  $F_2 \circ F_1$  is an  $(\alpha_1 + \alpha_2\beta_1, \beta_1\beta_2/\kappa)$ -solver for the same problem.

# Multiplicative Weights Update

We can reduce the problem

$$\begin{aligned} \min_{x \in \mathcal{X}} \|x\|_{\mathcal{X}} \\ \text{s.t. } \mathbf{A}x = b, \end{aligned}$$

to a feasibility problem, which we can approximately solve with the **multiplicative weights update method**.

# Multiplicative Weights Update

We can reduce the problem

$$\begin{aligned} \min_{x \in \mathcal{X}} \|x\|_{\mathcal{X}} \\ \text{s.t. } \mathbf{A}x = b, \end{aligned}$$

to a feasibility problem, which we can approximately solve with the **multiplicative weights update method**.

Consider an arbitrary decision and a panel of  $n$  experts. Over a series of rounds, the **multiplicative weights update method** rewards experts whose predictions are good and punishes experts whose predictions are poor.

As an iterative method, we can use the **composition of solvers theorem**.

# Earth Mover's Distance Problem

## Theorem (Bourgain's Embedding)

*Given a graph  $G = (V, E)$  and distance  $d : V \times V \rightarrow \mathbb{R}^+$ , there exists a mapping  $\phi : V \rightarrow [\Delta]^{\mathcal{O}(\log^2 n)}$  such that*

$$d_G(u, v) \leq \|\phi(u) - \phi(v)\|_1 \leq \mathcal{O}(\log n) d_G(u, v),$$

# Earth Mover's Distance Problem

## Theorem (Bourgain's Embedding)

Given a graph  $G = (V, E)$  and distance  $d : V \times V \rightarrow \mathbb{R}^+$ , there exists a mapping  $\phi : V \rightarrow [\Delta]^{\mathcal{O}(\log^2 n)}$  such that

$$d_G(u, v) \leq \|\phi(u) - \phi(v)\|_1 \leq \mathcal{O}(\log n) d_G(u, v),$$

We can reduce approximating the uncapacitated min-cost flow on  $G$  to approximating the cost of the **Earth Mover's Distance problem**.

The Earth Mover's Distance (EMD) problem is

$$\begin{aligned} \min_{\pi: V \times V \rightarrow \mathbb{R}_{\geq 0}} \quad & \sum_{(u,v) \in V \times V} \pi(u, v) \cdot \|\phi(u) - \phi(v)\|_1 \\ \text{s.t.} \quad & \forall u \in V, \sum_{v \in V} \pi(u, v) - \sum_{v \in V} \pi(v, u) = b_u. \end{aligned}$$

# Randomly Shifted Grids

We use randomly shifted grids to obtain a  $\beta$ -approximation to  $OPT_{EMD}$ .

Figure: Grids

# Randomly Shifted Grids

Figure: Grids with points

# Preconditioner

Construct a sequence of  $L = 1 + \log \Delta$  grids  $G_i$  and let  $\tau$  be a random variable over  $[\Delta]$ .

For each level  $i \in \{0, 1, \dots, L-1\}$ , each cell  $C \in G_i$ , and each shift value  $\tau \in [2^i]$ , we set  $h' \in \mathbb{R}^{\sum_{i=0}^{L-1} 2^i |G_i|}$  to

$$h'_{(i,C,\tau)} = d \cdot \sum_{v \in V: \phi(v) + \tau \cdot \mathbf{1}_d \in C} b_v$$

Then,

- ①  $OPT_{EMD}(b) \leq \|h'\|_1 \leq 2Ld \cdot OPT_{EMD}(b)$
- ②  $\kappa(P'AW^{-1}) \leq 2Ld\alpha$

# Preconditioner

Construct a sequence of  $L = 1 + \log \Delta$  grids  $G_i$  and let  $\tau$  be a random variable over  $[\Delta]$ .

For each level  $i \in \{0, 1, \dots, L-1\}$ , each cell  $C \in G_i$ , and each shift value  $\tau \in [2^i]$ , we set  $h' \in \mathbb{R}^{\sum_{i=0}^{L-1} 2^i |G_i|}$  to

$$h'_{(i,C,\tau)} = d \cdot \sum_{v \in V: \phi(v) + \tau \cdot 1_d \in C} b_v$$

Then,

- ①  $OPT_{EMD}(b) \leq \|h'\|_1 \leq 2Ld \cdot OPT_{EMD}(b)$
- ②  $\kappa(P'AW^{-1}) \leq 2Ld\alpha$

Observe that  $h'$  can be written as a linear map  $h' = Pb$  where

$$P'(i, C, \tau), v = \begin{cases} d & \phi(v) + \tau \cdot 1_d \in C \\ 0 & \text{otherwise} \end{cases}.$$

# Preconditioner

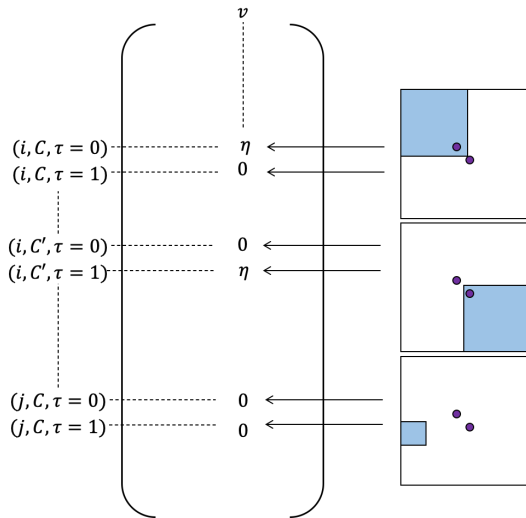

Figure: Preconditioner

# Compressed Representation

Given a vector  $x \in \mathbb{R}^r$ , a **compressed representation** of  $x$  is a set of tuples  $I = \{([a_1, b_1], c_1), ([a_2, b_2], c_2), \dots, ([a_s, b_s], c_s)\}$  where  $c_i \in \mathbb{R}$ ,  $[a_i, b_i] \subseteq [1, r]$  such that

- 1  $\forall i \neq j \in [s], [a_i, b_i] \cap [a_j, b_j] = \emptyset$
- 2  $\forall j \in [a_i, b_i], x_j = c_i$
- 3  $\forall j \in [1, r] \setminus \bigcup_{i \in [s]} [a_i, b_i], x_j = 0$

# Implicit Preconditioner

How can we construct our implicit preconditioner?

$$P'(i, C, \tau), v = \begin{cases} d & \phi(v) + \tau \cdot 1_d \in C \\ 0 & \text{otherwise} \end{cases}$$

Figure: Grid with shifted points

Fix a vertex  $v \in V$ , a level  $l \in L$ , and a cell  $C_k$ . If  $\exists \tau \in [2^l]$  such that  $\phi(v) + \tau \cdot 1_d \in C_k$ ,

- ①  $\tau_1 = \min_{\tau \in [2^l]: \phi(v) + \tau \cdot 1_d \in C_k} \tau$
- ②  $\tau_2 = \max_{\tau \in [2^l]: \phi(v) + \tau \cdot 1_d \in C_k} \tau$
- ③  $a \leftarrow (k-1)2^l + \sum_{j=0}^{l-1} 2^j |C_j|$
- ④  $I_v \leftarrow I_v \cup \{([a + \tau_1, a + \tau_2], d)\}$

# Implicit Preconditioner

Let  $x = \mathbf{W}f$ . Find the optimal  $x^*$  such that

$$\begin{aligned} x^* = \min_{x \in \mathbb{R}^m} \|x\|_1 \\ \text{s.t. } \mathbf{A}\mathbf{W}^{-1}x = b. \end{aligned}$$

# Implicit Preconditioner

Let  $x = \mathbf{W}f$ . Find the optimal  $x^*$  such that

$$\begin{aligned} x^* &= \min_{x \in \mathbb{R}^m} \|x\|_1 \\ \text{s.t. } \mathbf{A}\mathbf{W}^{-1}x &= b. \end{aligned}$$

## Theorem

Given an undirected graph  $G = (V, E, w)$  and a mapping  $\phi(v) : V \rightarrow [\Delta]^d$  such that

$$\forall u, v \in V, d_G(u, v) \leq \|\phi(u) - \phi(v)\|_1 \leq \alpha \cdot d_G(u, v),$$

we can *efficiently* compute a compressed representation  $I = (I_1, I_2, \dots, I_n)$  of a matrix  $P$  with full column rank and

- 1  $\kappa(P\mathbf{A}\mathbf{W}^{-1}) \leq \mathcal{O}(\alpha Ld)$
- 2 each  $I_i$  of size at most  $(d+1)L$

# Fast Operations

How can we do matrix-vector products with our compressed representation?

$MatVec(I = (I_1, I_2, \dots, I_n), g \in \mathbb{R}^n)$

①  $S \leftarrow \emptyset, \hat{I} \leftarrow \emptyset$

② For  $i \in [n] : g_i \neq 0$

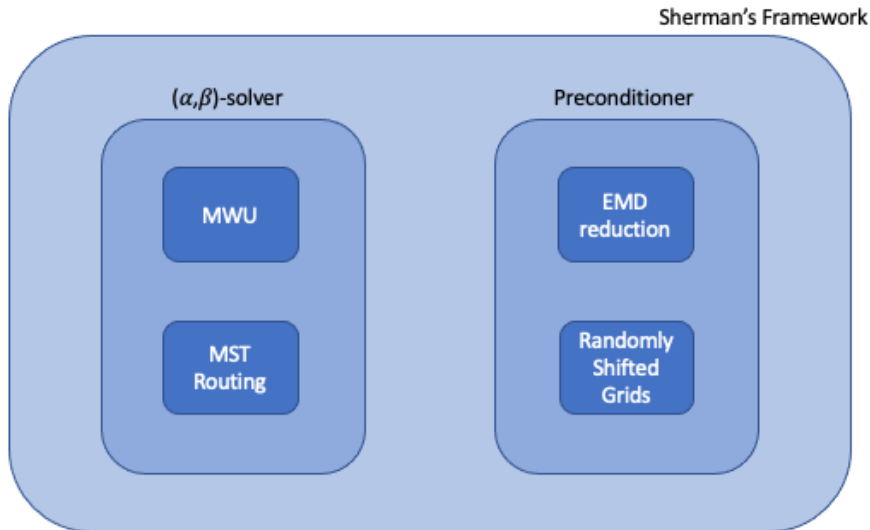

① for each  $([a, b], c) \in I_i, S \leftarrow S \cup \{(a, cg_i), (b+1, -cg_i)\}$

③ Sort  $S = \{(q_1, z_1), (q_2, z_2), \dots, (q_k, z_k)\}$  such that  
 $q_1 \leq q_2 \leq \dots \leq q_k$

④ For each  $j \in \{2, 3, \dots, k\} : q_j > q_{j-1}, \hat{I} \leftarrow$   
 $\hat{I} \cup \{([q_{j-1}, q_j - 1], \sum_{t: q_t < q_j} z_t)\}$

# Sherman's Framework

We use Sherman's framework to solve uncapacitated min-cost flow.

# Summary

- 1 Low Hop Emulators and Applications
- 2 Constructing a Low Hop Emulator
- 3 Uncapacitated Min-Cost Flow in Sherman's Framework
- 4 Constructing a Good Preconditioner

Thanks. Questions?
